

Building Azure Infrastructure

Put it all together — provision real resource groups and networking with the azurerm provider.

azurerm patterns

Reading the docs

Naming & tags

Networking

Lab 06

Today's roadmap

1 • The target architecture

What we'll build over the next few sessions.

2 • Reading provider docs

Turn a registry page into working HCL,

3 • Naming & tags

Conventions that keep a shared subscription sane.

4 • Lab 06

Create resource groups & a virtual network

01

The Target Architecture

One app, built across sessions 06–08.

What we'll provision

Resource groups

Separate groups for network, app and database.

Virtual network

A VNet with subnets for the workloads.

App Services

Frontend & backend Service plan.

PostgreSQL

A managed database for the backend.

Key Vault

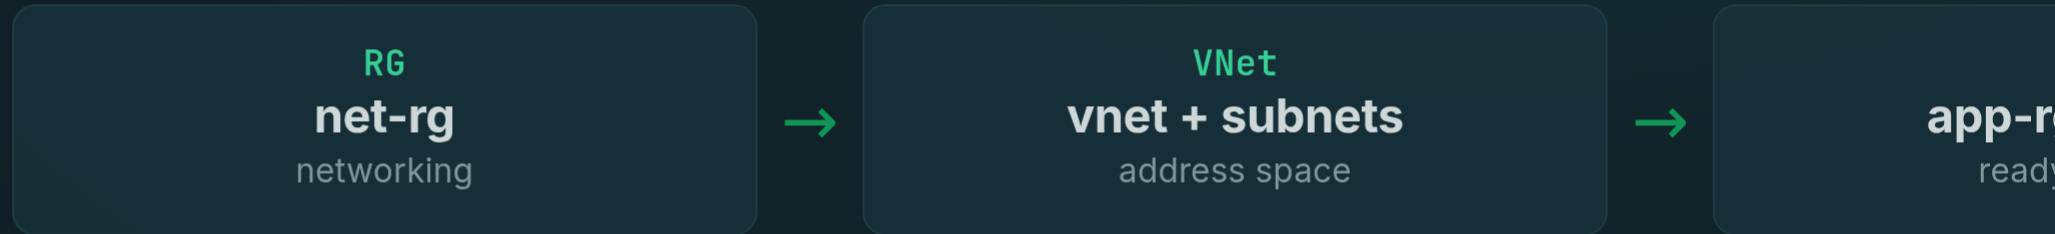

Secrets — imported in Session 08.

Tags everywhere

environment · owner every resource.

Resource groups → network

💡 The lab gives you the **properties** — you write the HCL by reading the docs. That's the

02

Working with azurem

Docs, conventions, and a resource-group example.

Reading provider documentation

Every resource has a registry page with **Arguments**, **Attributes** and examples.

- Required vs. optional arguments
- Attributes you can reference later (e.g. `.id`)
- Copy the example, then trim to what you need

HCL

```
resource "azurerm_resource_group" "net" {
  name      = "${local.prefix}-net-rg"
  location  = "westeurope"

  tags = {
    environment = "prod"
    owner       = var.owner
    type        = "network"
  }
}
```

Naming & tags conventions

Prefix everything

Use your assigned `<prefix>` so names never collide in the shared subscription.

Consistent tags

environment · owner · type — set them in the `local.common_tags` map.

Region for the whole course: `westeurope`. Keep it consistent to simplify quotas and network.

Applying Azure infrastructure

BASH

```
terraform fmt
terraform init
terraform validate
terraform plan -out infraPlan
terraform apply infraPlan
```

- 💰 Real Azure resources cost money. Always read the plan, and **destroy** what you don't sessions.

 LIVE DEMO

Provision infra in Azure

Build resource groups, a virtual network, App Services and a PostgreSQL database — the full

`fmt → init → validate → plan → apply` loop.

Demo · 06 **Provider** · azurerm

 LAB 06 · 30-40 MIN

Resource groups & virtual network

Given only the properties, author the HCL for three tagged resource groups and a VNet — then apply and push to your course repo.

You'll practise: reading docs · tags via locals · `<prefix>` naming · plan files

Key takeaways

✓ Docs are the skill

Turn a registry page into working HCL.

✓ Conventions scale

Prefixes & shared tags keep things tidy

✓ Mind the cost

Read the plan; destroy what you don't need.

✓ Next up
